神代杉

Jindai Sugi

Precious cedar
awakened from
a long sleep

It has been 1,200 years since it's grew up in the distant Mt. Chokai. And it's been 800 years since it was embraced by the mountainside. The cedar of Jindai suddenly appeared. (Bark burnt and blackened by volcanic ash and bath rocks.)

Processed into
wood with the skillful
skill of a craftsman
who cuts wood

Mr. Suzuki from Tokyo, who was one of only four Kobiki-san in Japan at the time. It took him three months just to cut it into chunks with a custom-made seven-foot-long saw.

A precious wood that can
never be obtained again

Feel the weight of 36 tons of history.

The end diameter is 3m(10shaku). A majestic style that overwhelms even the earth with 1,200 years of tree rings.

Even with a 7-shaku measure, it feels small. Careful wood trimming according to the grain.

JINDAISUGI

Mt. Chokai Yamagata

*Giant tree awakened from sleep
since the Jomon period*

It is determined to be approximately 1,200 years old by dendrochronology.

This cedar tree has been buried underground for hundreds of years after being destroyed by a large explosion in 466 B.C. (2489 years ago).

Around the middle of the 1970s, it was discovered by chance during the development of residential land in Nikaho-cho, Yuri-gun, Akita Prefecture.

The tree is about 1,200 years old, has a circumference of 11.5 meters(38shaku) at chest height, a straight longitude of 3.5meters (12shaku), and a volume of 100cubic meters(360)per tree. As domestic cedar, we will never see production again. Discovered by chance and miracle, this super-class precious wood is left by nature.

It is a precious human heritage.
